MIXING EDUCTORS

These eductors are the ideal devices for the continuous blending of liquids or solutions contained in tanks, when settling of heavier components and local variations of density must be avoided.

Stainless steel types are often used for steam heating processes in water tanks. The distinctive design incorporates the efficiency of the Venturi profile into a body with high structural strength, where the eductor is cast or moulded offering sturdy thick sections. This minimizes the danger of the eductor being damaged in the course of maintenance work.

Maximum operating temperature LT 80° C (PP) - 90° C (PVDF)

- Materials B31 AISI 316L Stainless steel
 - D6 PP, chemically bonded fiberglass

D82 PVDF, moulded (3/8" Parallel Male thread)

The table aside shows the eductor water capacity as a function of the pressure drop between the inlet pressure and the outlet back pressure.

See the diagram beside for steam heating, full lines show Heat Quantity, broken lines Steam Capacity, as a function of feed pressure.

The graph on the left shows the effective range of type UPB E100, as tested in a water tank at 50 cm depth.

Under normal working conditions, for feed pressure values between 2 and 4 Bar, eductors with a total capacity equal to 20% of the liquid volume to be agitated has proven adequate for most applications.

Detailed suggestions about eductor layouts inside tanks are shown in product Data Sheet.

MIXING EDUCTORS

UPD series eductors are similar to the UPB series, the only difference is that they are supplied with a female thread connection.

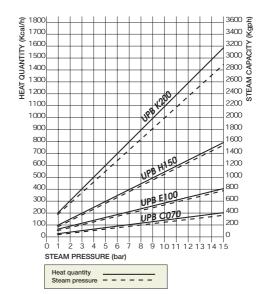

This design offers the advantage of an easier removal from the feed pipe, should the eductor be broken while the plant is serviced.
